CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Methods for cell lysis and purification of biological materials, involving subjecting a sample maintained at a subzero temperature to high pressure, are disclosed. Apparatus for practicing the methods are also disclosed. The cell or **cells** that are **lysed** may be in suspension or part of a tissue. They are **lysed** by a method that includes: (i) providing a frozen cell or **cells** under atmospheric pressure; (ii) while maintaining the cell or **cells** at a subzero temperature, exposing the cell or **cells** to an elevated pressure in a **pressure chamber**, the elevated pressure being sufficient to thaw the frozen cell or **cells** at the subzero temperature; (iii) depressurizing the **pressure chamber** to freeze the cell or **cells** at the subzero temperature; and (iv) repeating the exposing and depressurizing steps until the cell or **cells** are **lysed**. This method can lyse a cell or **cells** with or without cell walls; such **cells** include, but are not limited to, bacteria, viruses, fungal **cells** (e.g, yeast **cells**), plant **cells** (e.g, corn leaf tissue), animal **cells**, insect **cells**, and protozoan **cells**.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The present invention provides a miniaturized integrated nucleic acid diagnostic device and system. The device of the invention is generally capable of performing one or more sample acquisition and preparation operations, in combination with one or more sample analysis operations. For example, the device can integrate several or all of the operations involved in sample acquisition and storage, sample preparation and sample analysis, within a single integrated unit. The device is useful in a variety of applications, and most notably, nucleic acid based diagnostic applications and de novo sequencing applications.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB This invention provides vaccine compositions, methods of producing same
 and methods for protecting porcine animals against disease associated
 with infection by toxigenic Pasteurella multocida. The vaccines of this
 invention contain effective amounts of a P. multocida bacterin with a
 cell-bound toxoid and, optionally, a P. multocida free toxoid.

AB Monoclonal antibodies specific for epitopes found on the B chain of PDGF (including v-sis, c-sis and platelet-derived forms) may be bound to

columns and used for purification of rPDGF B. A solution containing a polypeptide possessing at least part of the structural conformation of rPDGF B is passed over such a column and the rPDGF B is bound to the antibody. The rPDGF B may then be eluted from the column to yield rPDGF B of greater than 95% purity as determined by SDS-PAGE.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Devices and methods are provided for determining the presence and amount of an analyte by measuring a redox potential-modulated photoinducing signal from a photoresponsive element. Further devices and methods are provided for determining the presence and amount of an analyte by measuring a redox potential, pH or ion modulated photoinduced signal from a photoresponsive element, where one signal is a constant system and the other signal(s) is a variable system. The constant system signal is used to standardize the variable system signal. Various protocols may be employed where an analyte may be directly or indirectly coupled to a redox couple, a pH or ion system for detection. The latter devices employ a photoresponsive element having a medium contacting surface, which is partially covered with an electronically conducting layer and partially covered with a protective insulative layer.

| AB Methods for cell lysis and purifn. of biol. materials, involving subjecting a sample maintained at a subzero temp. to high pressure, are disclosed. App. for practicing the methods are also disclosed. The cell or cells that are lysed may be in suspension or part of a tissue. They are lysed by a method that includes: (i) providing a frozen cell or cells under atm. pressure; (ii) while maintaining the cell or cells at a subzero temp., exposing the cell or cells to an elevated pressure in a pressure chamber , the elevated pressure being sufficient to thaw the frozen cell or cells at the subzero temp.; (iii) depressurizing the pressure chamber to freeze the cell or cells at the subzero temp.; and (iv) repeating the exposing and depressurizing steps until the cell or cells are lysed . This method can lyse a cell or cells with or without cell walls; such cells include, but are not limited to, bacteria, viruses, fungal cells (e.g, yeast cells), plant cells (e.g, corn leaf tissue), animal cells , insect cells , and protozoan cells . Yeast cells were lysed by a five min. pressurization process consisting of cycling the pressure between 1 ATM and 37 kpsi five times at -15.degree.. Genomic DNA, rRNA, and tRNA could be purified. | | | | | | | | | | | | | | | | |
